

# Raw Font Tables

Scott Pakin, *scott+cls@pakin.org*

April 12, 2026

This document presents, in alphabetical order, font tables for all<sup>1</sup> of the fonts that appear in the *Comprehensive L<sup>A</sup>T<sub>E</sub>X Symbol List*. It was mechanically produced using a script that extracts the list of fonts used by the *Comprehensive L<sup>A</sup>T<sub>E</sub>X Symbol List* and typesets all characters in each font in a per-font table. The purpose of this document is to provide a companion mechanism for locating symbols by organizing the myriad symbols available to T<sub>E</sub>X and L<sup>A</sup>T<sub>E</sub>X by font family rather than by L<sup>A</sup>T<sub>E</sub>X symbol name. It may also reveal some unnamed symbols—or symbols overlooked by the *Comprehensive L<sup>A</sup>T<sub>E</sub>X Symbol List*.

On the other hand, not every symbol shown in the *Comprehensive L<sup>A</sup>T<sub>E</sub>X Symbol List* appears in this document. Some symbols are defined by juxtaposing multiple other symbols; some symbols are defined in terms of graphics primitives instead of fonts. The tables shown in this document are strictly those that correspond to “true” fonts—glyphs drawn in METAFONT, OpenType, TrueType, or PostScript Type 1.

In each table, characters are numbered in base 16 (hexadecimal). A character’s hexadecimal position is formed by taking the first hexadecimal digits from a table’s left column and the final hexadecimal digit from either the top or the bottom row, based on whether the character lies in the upper or lower row associated with the first hexadecimal digits. To clarify this description with an example, the “△” symbol in the `cmsy10` table can be produced by `\char"34`. The “℔” symbol that lies directly beneath that in the table can be produced by `\char"3C`. The decimal equivalents of these are `\char52` and `\char60`, and their character equivalents are “4” and “<”, respectively.

To put this means of character usage in context, suppose we want to typeset `\sqiiint` (“ $\iiint$ ”) from the `txfonts` package. `txfonts` is a large package that redefines all text and math fonts, which may not be desirable if all that is desired is to typeset a single symbol. The following explains how to typeset a single `txfonts` symbol without having to load the entire package.

We observe that the symbol in question is character 52 hexadecimal in the `txexa` table in this document. The first step is to associate `txexa` with a T<sub>E</sub>X control sequence; here we call it `\myfont`:

```
\font\string\myfont=txexa at 10pt
```

(If our document were typeset in a font size other than 10 pt., we would specify that size in the above.) We then define a macro, here `\mysqiiint`, that sets the font and typesets a single character:

```
\newcommand*\mysqiiint{{\myfont\char"52}}
```

The extra pair of curly braces in the above limits the font change to the single character we want to typeset. We can now use `\mysqiiint` without having to load the `txfonts` package.

Alas, in this case the symbol winds up being typeset below the baseline. This is an artifact of typesetting a mathematical symbol outside of math mode. The solution is to explicitly raise the symbol to the desired height:

```
\newcommand*\mysqiiint{{\raisebox{10pt}{\myfont\char"52}}}
```

Note that the `amstext` package’s `\text` command is a useful mechanism for typesetting text characters in math mode.

---

<sup>1</sup>Redundant fonts are omitted. For example, bold and italic variants are deemed redundant with the corresponding roman font; different-sized fonts for the same typeface are deemed redundant; and fonts with similar typefaces but the same encoding are deemed redundant.
